Mechanistic organic photochemistry is the aspect of organic photochemistry which seeks to explain the mechanisms of organic photochemical reactions. The absorption of ultraviolet light by organic molecules often leads to reactions. In the earliest days, sunlight was employed, while in more modern times ultraviolet lamps are employed.

• The first law of photochemistry, the Grothuss-Draper law, states that light must be absorbed by a compound in order for a photochemical reaction to take place. • The second law of photochemistry, the Stark-Einstein law, states that for each photon of light absorbed by a chemical system, only one molecule is activated for subsequent reaction.This "photoequivalence law" was derived by ...

The aim of organic photochemistry is to replace either thermal activation or the use of reactive substances with photons (light) for the transformation of organic molecules. Excitation of a substance leads to an excited state, usually very energetic, which can evolve toward the desired product, or lead to a nonselective degradation.
